

Request for grant of a patent

(See the notes on the back of this form. You can also get an explanatory leaflet from the Patent Office to help you fill in this form)

The Patent Office

Cardiff Road
Newport
Gwent NP9 1RH

1. Your reference P22833/HGR/GMU

2. Patent application number
(The Patent Office will fill in this part)

9823669.8

3. Full name, address and postcode of the or of each applicant (underline all surnames)

Serck Heat Transfer Limited
Warwick Road
BIRMINGHAM
B11 2QY

Patents ADP number (if you know it)

If the applicant is a corporate body, give the country/state of its incorporation

United Kingdom

4. Title of the invention

"Exhaust Gas Cooler"

5. Name of your agent (if you have one)

Murgitroyd & Company

"Address for service" in the United Kingdom to which all correspondence should be sent (including the postcode)

373 Scotland Street
GLASGOW
G5 8QA

RECEIVED
SEP 13 2001
TC 1700

Patents ADP number (if you know it)

1198013

6. If you are declaring priority from one or more earlier patent applications, give the country and the date of filing of the or of each of these earlier applications and (if you know it) the or each application number

Country

Priority application number
(if you know it)

Date of filing
(day / month / year)

7. If this application is divided or otherwise derived from an earlier UK application, give the number and the filing date of the earlier application

Number of earlier application

Date of filing
(day / month / year)

8. Is a statement of inventorship and of right to grant of a patent required in support of this request? (Answer 'Yes' if:

- a) any applicant named in part 3 is not an inventor, or
 - b) there is an inventor who is not named as an applicant, or
 - c) any named applicant is a corporate body.
- See note (d))

Yes

1 Exhaust Gas Cooler

2

3 This invention relates to an exhaust gas cooler for
4 reducing the temperature of exhaust gases from internal
5 combustion engines. In particular the invention
6 relates to an exhaust gas cooler in which a coolant is
7 passed around passages through which the exhaust gas
8 travels.

9

10 Figs. 1a to 1d show a known exhaust gas cooler. This
11 prior art cooler comprises a circular tube 1 which has
12 tapered ends 2 which serve as entry 3 and exit 4
13 orifices for exhaust gases. The orifices are provided
14 with flange plates 10 for connection to exhaust pipes.
15 The ends of the tube are sealed by circular tube plates
16 5 which define a coolant chamber inside the tube. Each
17 tube plate 5 has a number of circular holes 6 arranged
18 through it. The holes 6 in each tube plate 5 are
19 connected by a number of small diameter tubes 7 which
20 are sealed at one end to the first tube plate and at
21 the other end to the second tube plate. Exhaust gases
22 flow into the entry orifice 3, along the inside of the
23 small diameter tubes 7 and out of the exit orifice 4.
24 The exterior of the tube is provided with entry and
25 exit nozzles 8, 9 which communicate with the coolant

1 chamber for the supply of coolant liquid.

2

3 The prior art exhaust gas coolers are bulky and do not
4 fit easily within the frequently cramped engine layout.
5 It is an object of the present invention to provide an
6 exhaust gas cooler which is more compact in shape and
7 yet provides flow characteristics comparable to prior
8 art gas coolers.

9

10 According to a first aspect of the present invention
11 there is provided an exhaust gas cooler comprising:

12 an external tube having first and second end walls
13 within said tube, said external tube and end walls
14 defining a coolant chamber between said end walls and
15 first and second exhaust gas chambers outside said
16 first and second end walls respectively,

17 coolant inlet and outlet means communicating with
18 said coolant chamber,

19 a plurality of internal tubes extending from said
20 first end wall to said second end wall and arranged
21 such that the interior of each internal tube
22 communicates with said first and second exhaust gas
23 chambers, and

24 exhaust gas inlet and outlet means communicating
25 with said first and second exhaust gas chambers
26 respectively,

27 wherein the external tube has a cross-sectional shape
28 which has a length in the major axis which is greater
29 than its width in the minor axis perpendicular to the
30 major axis.

31

32 Preferably the cross-sectional shape of the external
33 tube is substantially oval, most preferably it
34 comprises two semi-circles connected by common straight
35 line tangents parallel to the major axis. Such a
36 cross-sectional shape means that the exterior tube has

1 a planar face which simplifies the fitting of mounting
2 brackets and placement within an engine compartment.
3 An oval shape offers advantages over rectangular cross-
4 sectional shapes, since the tube is less prone to
5 cracking, and sharp re-entrant angles in the tube are
6 avoided, reducing stress concentration.

7
8 Preferably the internal tubes are circular in cross-
9 section. It has been found that circular tubes are
10 less prone to clogging with particles carried by the
11 exhaust gases than rectangular tubes, because they do
12 not present internal corners in which particulate
13 matter can collect.

14
15 Preferably the internal tubes are arranged in a
16 hexagonal close packed arrangement, such that each
17 internal tube is spaced by the same spacing from its
18 closest neighbouring internal tubes. Preferably the
19 spacing is less than 2 mm, most preferably less than 1
20 mm. Preferably the spacing is between 10% and 20% of
21 the diameter of the tubes.

22
23 Preferably the exhaust gas cooler is made from
24 stainless steel.

25
26 Preferably each of the exhaust gas inlet and outlet
27 means comprises a flange plate adapted to connect to a
28 corresponding flange plate on a connecting exhaust pipe
29 and having an aperture therein to permit the through
30 flow of exhaust gases. Preferably each of said first
31 and second exhaust gas chambers is further defined by a
32 tapering cylindrical member extending from said
33 aperture to said external tube.

34
35 Preferably the coolant inlet and outlet means comprise
36 tubular pipes adapted to be connected to a coolant

1 hose, most preferably extending substantially in the
2 plane containing the longitudinal axis of the external
3 tube and the major axis of the cross-section of the
4 external tube. Preferably the coolant inlet means is
5 located adjacent to one of the first and second end
6 walls and the coolant outlet means is located adjacent
7 to the other of the first and second end walls.

8

9 An embodiment of the invention will now be described,
10 by way of example only, with reference to the
11 accompanying figures, where:

12

13 Figs. 1a, 1b, and 1c are a side elevation, a partial
14 sectional view on line A-A, and an end elevation of a
15 prior art exhaust gas cooler;

16

17 Fig. 1d is an elevation on the flange plate of the
18 exhaust gas cooler of Fig. 1a;

19

20 Fig. 2 is a side elevation of an exhaust gas cooler
21 according to a first aspect of the invention;

22

23 Fig. 3 is an end elevation of the device of Fig. 2; and

24

25 Fig. 4 is a sectional view on line B-B of the device of
26 Fig. 2.

27

28 Referring to Figs. 2 to 4 there is shown an exhaust gas
29 cooler according to the invention. The cooler
30 comprises an external cylindrical tube 20 whose cross-
31 section comprises two semi-circular portions 21, 22
32 connected by two tangential portions 23, 24. At each
33 end of the tube are fixed tapered cap portions 25 which
34 are adapted to fit over the end of the tube and be
35 fastened by suitable means such as welding. At the
36 narrow end of the tapered cap portion 25 is a flange

1 plate 26 provided with two holes 27 for attachment to a
2 corresponding flange plate (not shown) in order to
3 secure the cooler to an exhaust pipe or line (not
4 shown). The flange plates 26 also each contain a
5 larger hole which serves as an entry 28 or exit 29
6 orifices for exhaust gases.

7
8 The ends of the tube 20 are sealed internally by two
9 oval tube plates 30 whose shape corresponds to the
10 internal profile of the tube 20. The volume bounded by
11 the tube 20 and plates 30 forms a coolant chamber 31
12 inside the tube. Each tube plate 30 has 37 circular
13 holes 32 arranged through it. The holes 32 are
14 arranged in a close hexagonal packing (CHP) pattern as
15 shown in Fig. 4. The holes 32 in each tube plate 30
16 are connected by 37 small diameter tubes 32 which are
17 sealed at one end to the first tube plate and at the
18 other end to the second tube plate.

19
20 It has been found that a CHP pattern maximises the flow
21 efficiency, while the particular arrangement of Fig. 4,
22 in which the three principal axes are arranged
23 perpendicular to and at 30° to the major axis 40 of the
24 tube 20 provides an optimum means of packing the
25 interior tubes within the exterior tube.

26
27 Exhaust gases flow into the entry orifice 28, along the
28 inside of the small diameter tubes 32 and out of the
29 exit orifice 29. The tubes 32 have a diameter of
30 between 5 and 8 mm, usually about 6.5 mm. The spacing
31 between the tubes is about 1 mm or less, so the tube
32 plate 30 does not present a significant obstruction to
33 flow of the exhaust gases.

34
35 Arranged at a first end of the exterior tube is a
36 cooling water inlet pipe 33 whose longitudinal axis is

1 in the same plane as the longitudinal axis 50 and the
2 major axis 40 of the exterior cylinder 20. In this way
3 the hose connections (not shown) will not extend
4 outside the envelope defined by the width W of the
5 exterior tube 20. Similarly at the second end of the
6 exterior tube 20 is a cooling water outlet pipe 34
7 whose axis is in the same plane as that of the inlet
8 pipe 33. The inlet and outlet pipes 33, 34 each
9 communicate with the coolant chamber 31 for the supply
10 of coolant liquid. As coolant passes from the inlet 33
11 to the outlet 34 and exhaust gases pass along the small
12 diameter tubes 32, heat transfer takes place from the
13 exhaust gas via the surfaces of the small diameter
14 tubes 32 to the cooling water.

15
16 The oval shape of the apparatus enables the exhaust gas
17 cooler of the invention to fit into much tighter spaces
18 in the engine compartment than prior art coolers, while
19 maintaining the benefits of closely packed tubes
20 forming the cooling core. The layout of the tubes in
21 the cooler according to the invention is novel while
22 still maximising the efficiency of the gas and coolant
23 flow. The cooler is highly resistant to corrosion due
24 to its stainless steel construction, and very robust
25 due to the absence of sharp corners on the exterior
26 tube. The flow patterns achieved in testing have shown
27 that the arrangement provides a high resistance to
28 clogging from soot particles.

29
30 Although the invention shows a close packing
31 arrangement with 37 tubes, giving the same flow area as
32 prior art tubes, it is to be understood that other
33 arrangements are possible. For example additional rows
34 of tubes can be added, increasing the length L, without
35 increasing the width W of the exterior tube 20.

36

1 These and other modifications and improvements can be
2 incorporated without departing from the scope of the
3 invention.
